

L4S: Low packet Loss and Low queuing Latency for Scalable throughput

Persistent Low Latency
for the Metaverse

Koen De Schepper
November 2022

What problem is solved with L4S?

Why is video conferencing not working all the time perfectly??

Why are websites and documents in the cloud sometimes responding so slow??

Sometimes delays of seconds

**Sometimes lags of 100s of ms and
freezes of seconds**

Why is (cloud) gaming experience not optimal?

What is the reason?

SPEEDTEST

Throughput?

enough available
to support a lot
of applications,
but still...

DOWNLOAD

166.0

Mbps

PING

13

ms

Latency?

we develop networks with lower
and lower latency capabilities,
but still...

UPLOAD

16.6

Mbps

JITTER

5

ms

latency stays the major problem for home workers and gamers

Latency under load?

SpeedTest with parallel ping

SPEEDTEST

ping -t 8.8.8.8

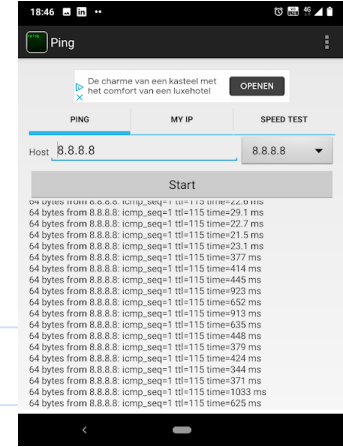

```
Command Prompt
Reply from 8.8.8.8: bytes=32 time=18ms TTL=119
Reply from 8.8.8.8: bytes=32 time=138ms TTL=119
Reply from 8.8.8.8: bytes=32 time=155ms TTL=119
Reply from 8.8.8.8: bytes=32 time=76ms TTL=119
Reply from 8.8.8.8: bytes=32 time=730ms TTL=119
Reply from 8.8.8.8: bytes=32 time=71ms TTL=119
Reply from 8.8.8.8: bytes=32 time=93ms TTL=119

```

Latency during SpeedTest with Ping to 8.8.8.8 [ms]

Latency under Load

SpeedTest on Mobile 4G Network

Seconds (!)

Latency during Speedtest on Mobile 4G network [seconds]

Latest Speedtest update

Isn't latency more important?

Good News:

Now **latency under load** is added:

Though **very conservative values** are used (even not yet average?)

Better for a next release?

Focus on **peak latency**:
(or 99th percentile)

as these **waiting times** are today **more relevant for user experience** than throughput

L4S can keep peak latencies in the same order of magnitude as the idle latency...
(often only 1 or a few ms queue latency higher)

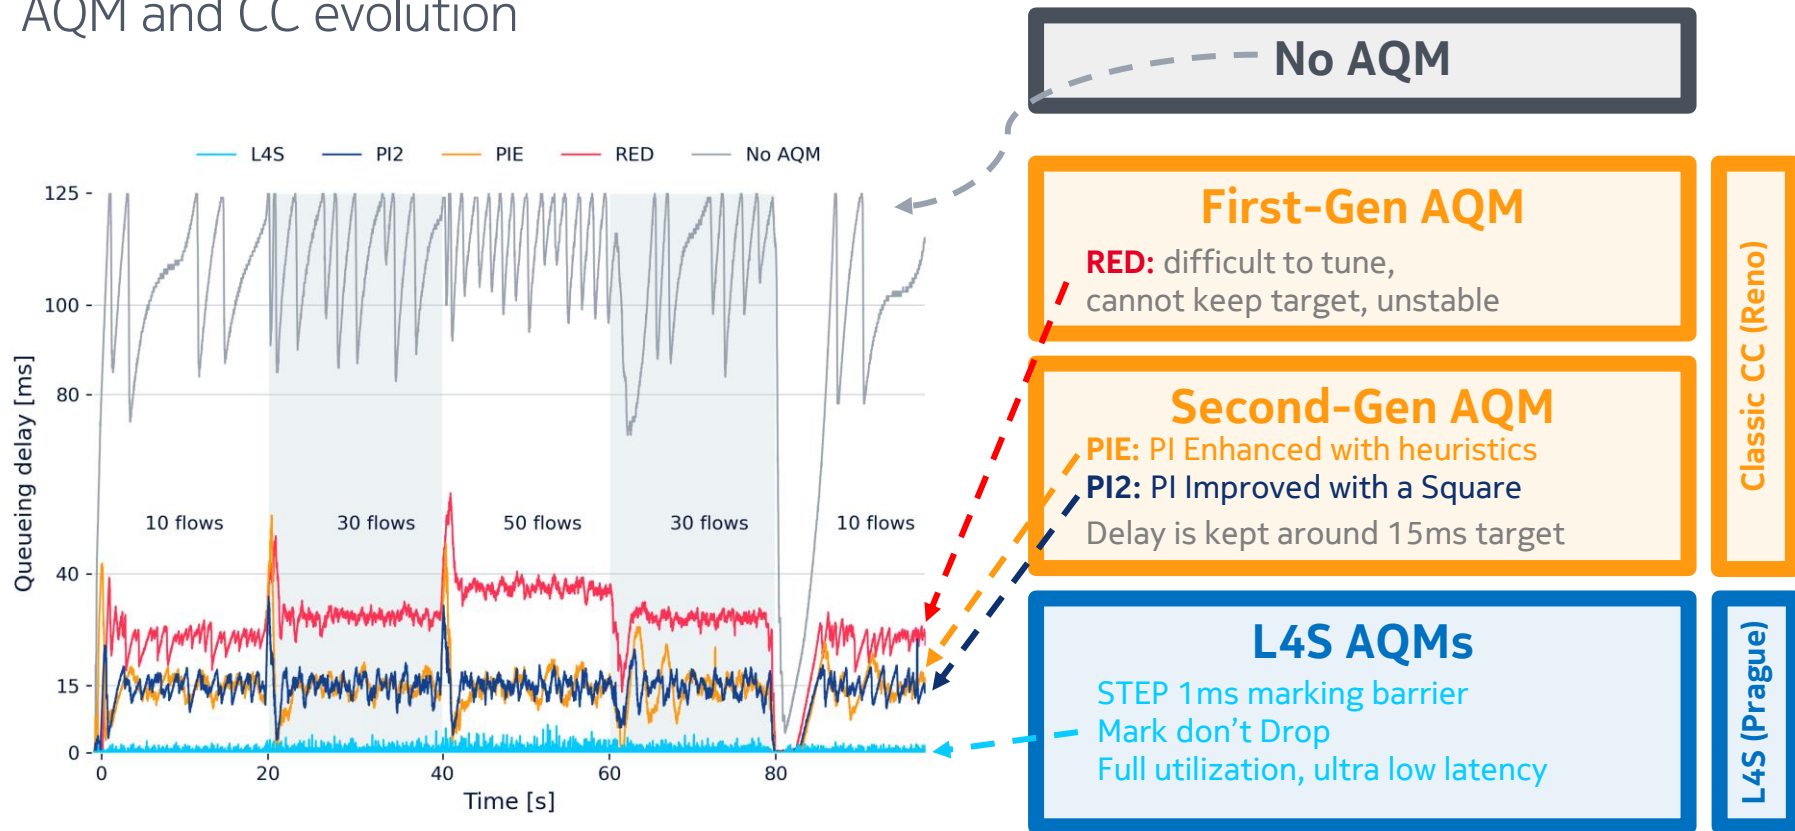

Goal of L4S

Reduce Latency under Load

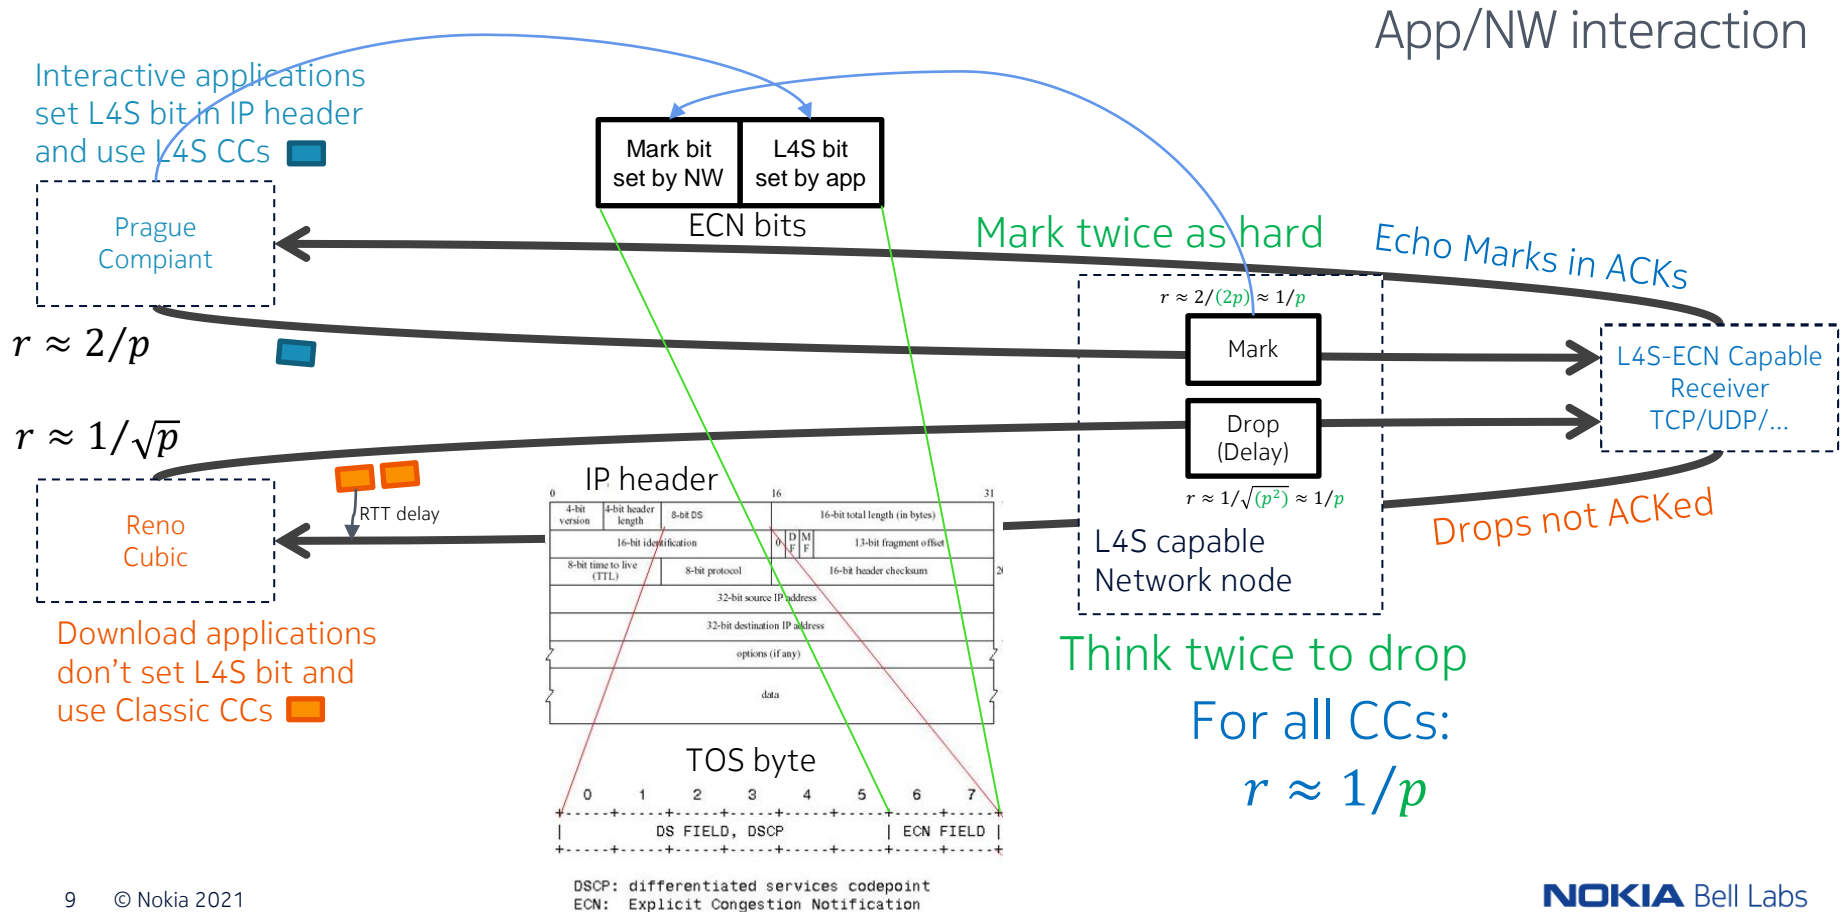

L4S

AQM and CC evolution

How to control both L4S CCs and Classic CCs

IETF

L4S drafts are ready and will become RFC soon

Architecture explained in [draft-ietf-tsvwg-l4s-arch](#)

Requirements specified in the L4S-ID draft [draft-ietf-tsvwg-ecn-l4s-id](#) :

- for NW: L4S identification protocol (ECN bits) and mark/drop relationship (squaring classic drops and doubling L4S marks)
- for End-Systems: Prague requirements (Low Latency congestion control)

Example reference NW AQM implementation: DualPI2 draft

- IETF draft: [draft-ietf-tsvwg-aqm-dualq-coupled](#)
- Open-source code: [linux/sch_dualpi2.c at testing · L4STeam/linux \(github.com\)](#)

Example reference TCP CC implementation: TCP-Prague draft

- IETF draft: [draft-briscoe-iccrp-prague-congestion-control](#)
- Open-source code: [linux/tcp_prague.c at testing · L4STeam/linux \(github.com\)](#)

[L4STeam/linux: Kernel tree containing patches for TCP Prague and the dualpi2 qdisc \(github.com\)](#) (also including BBRv2 and Accurate ECN implementations)

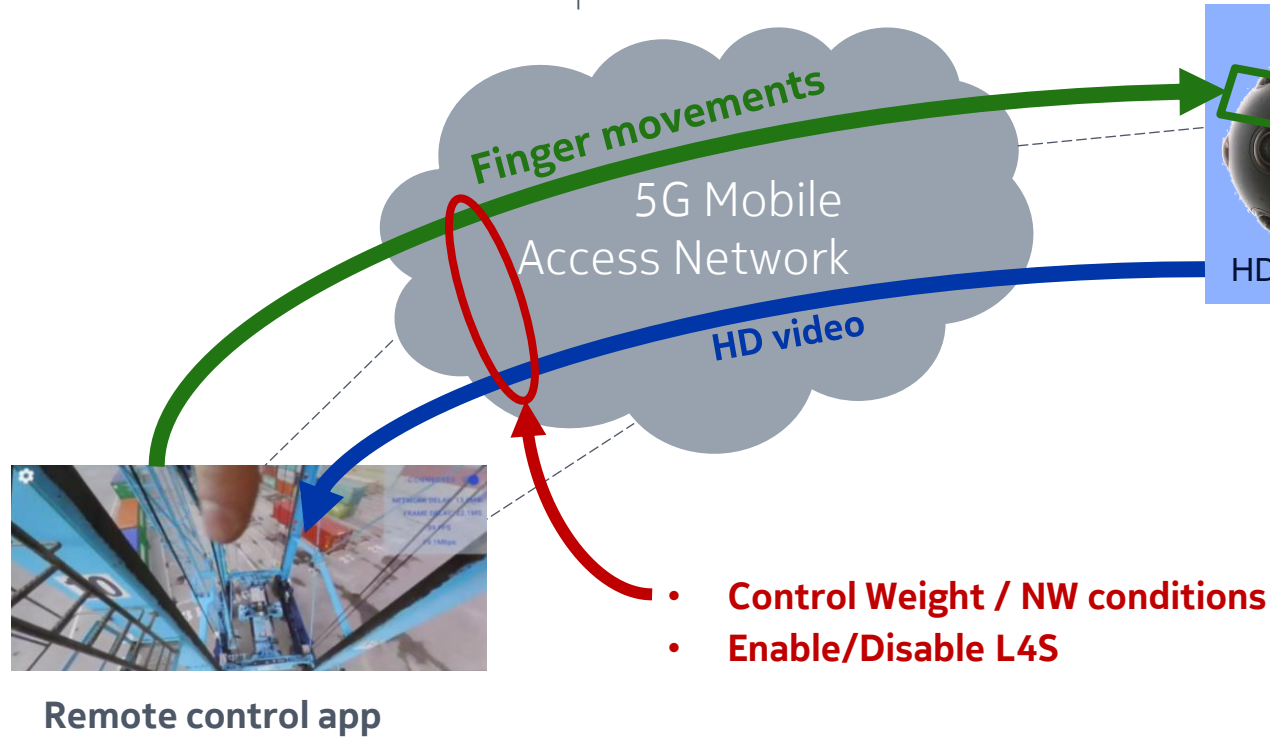

First IETF L4S Interop was a big success
Second is active
now

Effect on Remote Control use cases

Remote control of 360° viewpoint

Latency is key for interactive applications

Safety-critical applications must still work even if the SLA is degraded

SLA of 25Mbps & 30ms, app uses 20Mbps

High Video Resolution
User has full remote control

SLA degraded to ~15Mbps and **no L4S**

Video slows down, delays and skips fragments
User loses control

SLA degraded to <7Mbps and **L4S**

Slightly Reduced Video Resolution
User keeps full remote control

Setup: Cloud-rendered/encoded video towards lightweight client sending motion events to control the view position

Latency is key for interactive applications

Safety-critical applications must still work even if the SLA is **drastically** degraded

SLA degraded to <0.5Mbps and **no L4S**

Video stops, applications often crash
Total loss of control

SLA degraded to <0.5Mbps and **L4S**

Like bad weather conditions
User keeps full remote control

Setup: Cloud-rendered/encoded video towards lightweight client sending motion events to control the view position

Conclusions

Collaboration between NW and Applications with L4S:

- ✓ allows graceful degradation, preserving low latency
- ✓ improves scalable deployment of interactive applications (more peak users)
- ✓ Improved latency performance of link technologies are directly exploitable (today queuing spoils all efforts below 10s of ms)

Remote presence /
Teleoperation
